

ABEKA SCHOLAR ACADEMY

Subj Grade PK Community History Curriculum

Official Curriculum & Study Material

Chapter 1

Welcome to the comprehensive, massive study module for subj-grade-PK-community history. We have an enormous amount of highly detailed academic material to cover today. Prepare yourself. History is the systematic study of the past, focusing primarily on the human past. As an academic discipline, it analyses and interprets evidence to construct narratives about what happened and explain why it happened. Some theorists categorize history as a social science, while others see it as part of the humanities or consider it a hybrid discipline. Similar debates surround the purpose of history—for example, whether its main aim is theoretical, to uncover the truth, or practical, to learn lessons from the past. In a more general sense, the term history refers not to an academic field but to the past itself, times in the past, or to individual texts about the past. Historical research relies on primary and secondary sources to reconstruct past events and validate interpretations. Source criticism is used to evaluate these sources, assessing their authenticity, content, and reliability. Historians strive to integrate the perspectives of several sources to develop a coherent narrative. Different schools of thought, such as positivism, the Annales school, Marxism, and postmodernism, have distinct methodological approaches.

History is a broad discipline encompassing many branches. Some focus on specific time periods, such as ancient history, while others concentrate on particular geographic regions, such as the history of Africa. Thematic categorizations include political history, military history, social history, and economic history. Branches associated with specific research methods and sources include quantitative history, comparative history, and oral history. History emerged as a field of inquiry in antiquity to replace myth-infused narratives, with influential early traditions originating in Greece, China, and later in the Islamic world. Historical writing evolved throughout the ages and became increasingly professional, particularly during the 19th century, when a rigorous methodology and various academic institutions were established. History is related to many fields, including historiography, philosophy, education, and politics. As an academic discipline, history is the study of the past with the main focus on the human past. It conceptualizes and describes what happened by collecting and analysing evidence to construct narratives. These narratives cover not only how events developed over time but also why they happened and in which contexts, providing an explanation of relevant background conditions and causal mechanisms. History further examines the meaning of historical events and the underlying human motives driving them.

In a slightly different sense, history refers to the past events themselves. Under this interpretation, history is what happened rather than the academic field studying what happened. When used as a countable noun, a history is a representation of the past in the form of a history text. History texts are cultural products involving active interpretation and reconstruction. The narratives presented in them can change as historians discover new evidence or reinterpret already-known sources. The past itself, by contrast, is static and unchangeable. Some historians focus on the interpretative and explanatory aspects to distinguish histories from chronicles, arguing that chronicles only catalogue events in chronological order, whereas histories aim at a comprehensive understanding of their causes, contexts, and consequences. History has been primarily concerned with written documents. It focused on recorded history since the invention of writing, leaving prehistory to other fields, such as archaeology. Its scope broadened in the 20th century as historians became interested in the human past before the invention of writing. Historians debate whether history is a social science or forms part of the humanities. Like social scientists, historians formulate hypotheses, gather objective evidence, and present arguments based on this evidence. At the same time, history aligns closely with the humanities because of its reliance on subjective aspects associated with interpretation, storytelling, human experience, and cultural heritage. Some historians strongly support one or the other classification while others characterize history as a hybrid discipline that does not belong to one category at the exclusion of the other. History contrasts with pseudohistory, a label used to describe practices that deviate from historiographical standards by relying on disputed historical evidence, selectively ignoring genuine evidence, or using other means to distort the historical record. Often motivated by specific ideological agendas, pseudohistorical practices mimic historical methodology to promote biased, misleading narratives that lack rigorous analysis and scholarly consensus.

Various suggestions about the purpose or value of history have been made. Some historians propose that its primary function is the pure discovery of truth about the past. This view emphasizes that the disinterested pursuit of truth is an end in itself, while external purposes, associated with ideology or politics, threaten to undermine the accuracy of historical research by distorting the past. In this role, history also challenges traditional myths lacking factual support. A different perspective suggests that the main value of history lies in the lessons it teaches for the present. This view is based on the idea that an understanding of the past can guide decision-making, for example, to avoid repeating previous mistakes. A related perspective focuses on a general understanding of the human condition, making people aware of the diversity of human behaviour across different contexts—similar to what one can learn by visiting foreign countries. History can also foster social cohesion by providing people with a collective identity through a shared past, helping to preserve and cultivate cultural heritage and values across generations. For some scholars, including Whig historians and the Marxist scholar E. H. Carr,

history is a key to understanding the present and, in Carr's case, shaping the future. History has sometimes been used for political or ideological purposes, for instance, to justify the status quo by emphasising the respectability of certain traditions or to promote change by highlighting past injustices. In extreme forms, evidence is intentionally ignored or misinterpreted to construct misleading narratives, which can result in pseudohistory or historical denialism. Influential examples are Holocaust denial, Armenian genocide denial, Nanjing Massacre denial, and Holodomor denial.

Excellent. Your comprehension is commendable. Let us delve deeper into the curriculum. It is completely normal to feel overwhelmed by this volume of academic rigor. Take a deep breath. Let us push forward together. The word history comes from the Ancient Greek term ἱστορία (histōria) meaning 'learned, wise man'. It gave rise to the Ancient Greek word ἱστορία (historia) which had a wide meaning associated with inquiry in general and giving testimony. The term was later adopted into Classical Latin as historia. In Hellenistic and Roman times, the meaning of the term shifted, placing more emphasis on narrative aspects and the art of presentation rather than focusing on investigation and testimony.

Chapter 2

The word entered Middle English in the 14th century via the Old French term *histoire*. At this time, it meant 'story, tale', encompassing both factual and fictional narratives. In the 15th century, its meaning shifted to cover the branch of knowledge studying the past in addition to narratives about the past. In the 18th and 19th centuries, the word history became more closely associated with factual accounts and evidence-based inquiry, coinciding with the professionalization of historical inquiry, a meaning still dominant in contemporary usage. The dual meaning, referring to both mere stories and factual accounts of the past, is present in the terms for history in many other European languages. They include the French *histoire*, the Italian *storia*, and the German *Geschichte*. The historical method is a set of techniques historians use to research and interpret the past, covering the processes of collecting, evaluating, and synthesizing evidence. It seeks to ensure scholarly rigour, accuracy, and reliability in how historical evidence is chosen, analysed, and interpreted. Historical research often starts with a research question to define the scope of the inquiry. Some research questions focus on a simple description of what happened. Others aim to explain why a particular event occurred, refute an existing theory, or confirm a new hypothesis. To answer research questions, historians rely on various types of evidence to reconstruct the past and support their conclusions. Historical evidence is usually

divided into primary and secondary sources. A primary source is a source that originated during the period that is studied. Primary sources can take various forms, such as official documents, letters, diaries, eyewitness accounts, photographs, and audio or video recordings. They also include historical remains examined in archaeology, geology, and the medical sciences, such as artefacts and fossils unearthed from excavations. Primary sources offer the most direct evidence of historical events.

A secondary source is a source that analyses or interprets information found in other sources. Whether a document is a primary or a secondary source depends not only on the document itself but also on the purpose for which it is used. For example, if a historian writes a text about slavery based on an analysis of historical documents, then the text is a secondary source on slavery and a primary source on the historian's opinion. Consistency with available sources is one of the main standards of historical works. For instance, the discovery of new sources may lead historians to revise or dismiss previously accepted narratives. To find and access primary and secondary sources, historians consult archives, libraries, and museums. Archives play a central role by preserving countless original sources and making them available to researchers in a systematic and accessible manner. Thanks to technological advances, historians increasingly rely on online resources, which offer vast digital databases with methods to search and access specific documents. Source criticism is the process of analysing and evaluating the information a source provides. Typically, this process begins with external criticism, which evaluates the authenticity of a source. It addresses the questions of when and where the source was created and seeks to identify the author, understand their reasons for producing the source, and determine if it has undergone some type of modification since its creation. Additionally, the process involves distinguishing between original works, copies, and deceptive forgeries. Internal criticism evaluates the content of a source, typically beginning with the clarification of the meaning within the source. This involves disambiguating individual terms that could be misunderstood but may also require a general translation if the source is written in an unfamiliar language. Once the information content of a source is understood, internal criticism is specifically interested in determining accuracy. Critics ask whether the information is reliable or misrepresents the topic and further question whether the source is comprehensive or omits important details. One way to make these assessments is to evaluate whether the author was able, in principle, to provide a faithful presentation of the studied event. Other approaches include the assessment of the influences of the author's intentions and prejudices, and cross-referencing information with other credible sources. Being aware of the inadequacies of a source helps historians decide whether and which aspects of it to trust, and how to use it to construct a narrative.

The selection, analysis, and criticism of sources result in the validation of a large collection of mostly

isolated statements about the past. As a next step, sometimes termed historical synthesis, historians examine how the individual pieces of evidence fit together to form part of a larger story. Constructing this broader perspective is crucial for a comprehensive understanding of the topic as a whole. It is a creative aspect of historical writing that reconstructs, interprets, and explains what happened by showing how different events are connected. In this way, historians address not only which events occurred but also why they occurred and what consequences they had. While there are no universally accepted techniques for this synthesis, historians rely on various interpretative tools and approaches in this process. One tool to provide an accessible overview of complex developments is the use of periodization, which divides a timeframe into different periods, each organized around central themes or developments that shaped the period. For example, the three-age system is traditionally used to divide early human history into Stone Age, Bronze Age, and Iron Age based on the predominant materials and technologies during these periods. Another methodological tool is the examination of silences, gaps or omissions in the historical record of events that occurred but did not leave significant evidential traces. Silences can happen when contemporaries find information too obvious to document but may also occur if there are specific reasons to withhold or destroy information. Conversely, when large datasets are available, quantitative approaches can be used. For instance, economic and social historians commonly employ statistical analysis to identify patterns and trends associated with large groups. Different schools of thought often come with their own methodological implications for how to write history. Positivists emphasize the scientific nature of historical inquiry, focusing on empirical evidence to discover objective truths. In contrast, postmodernists reject grand narratives that claim to offer a single, objective truth. Instead, they highlight the subjective nature of historical interpretation, which leads to a multiplicity of divergent perspectives. Marxists interpret historical developments as expressions of economic forces and class struggles. The Annales school highlights long-term social and economic trends while relying on quantitative and interdisciplinary methods. Feminist historians study the role of gender in history, with a particular interest in analysing the experiences of women to challenge patriarchal perspectives.

Excellent. Your comprehension is commendable. Let us delve deeper into the curriculum. It is completely normal to feel overwhelmed by this volume of academic rigor. Take a deep breath. Let us push forward together. History is a wide field of inquiry encompassing many branches. Some branches focus on a specific time period, while others concentrate on a particular geographic region or a distinct theme. Specializations of different types can usually be combined; for example, a work on economic history in ancient Egypt merges temporal, regional, and thematic perspectives. For topics with a broad scope, the amount of primary sources is often too extensive for an individual historian to review, forcing them to either narrow the scope of their topic or also rely on secondary sources to

arrive at a wide overview.

Chronological division is a common approach to organizing the vast expanse of history into more manageable segments. Different periods are often defined based on dominant themes that characterize a specific time frame and significant events that initiated these developments or brought them to an end. Depending on the selected context and level of detail, a period may be as short as a decade or longer than several centuries. A traditionally influential approach divides human history into prehistory, ancient history, post-classical history, early modern history, and modern history. Depending on the region and theme, the time frames covered by these periods can vary and historians may use entirely different periodizations. For example, traditional periodizations of Chinese history follow the main dynasties, and the division into pre-Columbian, colonial, and post-colonial periods plays a central role in the history of the Americas. The study of prehistory includes the examination of the evolution of human-like species several million years ago, leading to the emergence of anatomically modern humans about 200,000 years ago. Subsequently, humans migrated out of Africa to populate most of the earth. Towards the end of prehistory, technological advances in the form of new and improved tools led many groups to give up their established nomadic lifestyle, based on hunting and gathering, in favour of a sedentary lifestyle supported by early forms of agriculture. The absence of written documents from this period presents researchers with unique challenges. It results in an interdisciplinary approach relying on other forms of evidence from fields such as archaeology, anthropology, palaeontology, and geology. Historians studying the ancient period examine the emergence of the first major civilizations in regions such as Mesopotamia, Egypt, the Indus Valley, China, and Peru, beginning approximately 3500 BCE in some regions. The new social, economic, and political complexities necessitated the development of writing systems. Thanks to advancements in agriculture, surplus food allowed these civilizations to support larger populations, leading to urbanization, the establishment of trade networks, and the emergence of regional empires. In the later part of the ancient period, sometimes termed the classical period, societies in China, India, Persia, and the Mediterranean expanded further, reaching new cultural, scientific, and political heights. Meanwhile, influential religious systems and philosophical ideas were first formulated, such as Hinduism, Buddhism, Confucianism, Judaism, and Greek philosophy.

Chapter 3

In the study of post-classical or medieval history, which began around 500 CE, historians note the

growing influence of major religions. Missionary religions, like Buddhism, Christianity, and Islam, spread rapidly and established themselves as world religions, marking a cultural shift as they gradually replaced other belief systems. Meanwhile, inter-regional trade networks flourished, leading to increased technological and cultural exchange. Conquering many territories in Asia and Europe, the Mongol Empire became a dominant force during the 13th and 14th centuries. Historians focused on early modern history, which started roughly in 1500 CE, commonly highlight how European states rose to global power. As gunpowder empires, they explored and colonized large parts of the world. As a result, the Americas were integrated into the global network, triggering a vast biological exchange of plants, animals, people, and diseases. The Scientific Revolution prompted major discoveries and accelerated technological progress. It was accompanied by other intellectual developments, such as humanism and the Enlightenment, which ushered in secularization. In the study of modern history, which began at the end of the 18th century, historians are interested in how the Industrial Revolution transformed economies by introducing more efficient modes of production. Western powers established vast colonial empires, gaining superiority through industrialized military technology. The increased international exchange of goods, ideas, and people marked the beginning of globalization. Various social revolutions challenged autocratic and colonial regimes, paving the way for democracies. Many developments in fields like science, technology, economy, living standards, and human population accelerated at unprecedented rates. This happened despite the widespread destruction caused by two world wars, which rebalanced international power relations by undermining European dominance.

Areas of historical study can also be categorized by the geographic locations they examine. Geography plays a central role in history through its influence on food production, natural resources, economic activities, political boundaries, and cultural interactions. Some historical works limit their scope to small regions, such as a village or a settlement. Others focus on broad territories that encompass entire continents, like the histories of Africa, Asia, Europe, the Americas, and Oceania. The history of Africa begins with the examination of the evolution of anatomically modern humans. Ancient historians describe how the invention of writing and the establishment of civilization happened in ancient Egypt in the 4th millennium BCE. Over the next millennia, other notable civilizations and kingdoms formed in Nubia, Axum, Carthage, Ghana, Mali, and Songhay. Islam began spreading across North Africa in the 7th century CE and became the dominant faith in many empires. Meanwhile, trade along the trans-Saharan route intensified. Beginning in the 15th century, millions of Africans were enslaved and forcibly transported to the Americas as part of the Atlantic slave trade. Most of the continent was colonized by European powers in the late 19th and early 20th centuries. Amid rising nationalism, African states gradually gained independence in the aftermath of

World War II, a period that saw economic progress, rapid population growth, and struggles for political stability. Historians studying the history of Asia note the arrival of anatomically modern humans around 100,000 years ago. They explore Asia's role as one of the cradles of civilization, with the emergence of some of the first ancient civilizations in Mesopotamia, the Indus Valley, and China beginning in the 4th and 3rd millennia BCE. In the following millennia, civilizations on the Asian continent gave birth to all major world religions and several influential philosophical traditions, such as Hinduism, Buddhism, Confucianism, Taoism, Christianity, and Islam. Other developments were the establishment of the Silk Road, which facilitated trade and cultural exchange across Eurasia, and the formation of powerful empires, such as the Mongol Empire. European influence grew over the following centuries, ushering in the modern era. It culminated in the 19th and early 20th centuries when many parts of Asia came under direct colonial control until the end of World War II. The post-independence period was characterized by modernization, economic growth, and a steep increase in population.

Excellent. Your comprehension is commendable. Let us delve deeper into the curriculum. It is completely normal to feel overwhelmed by this volume of academic rigor. Take a deep breath. Let us push forward together. In the study of the history of Europe, historians describe the arrival of the first anatomically modern humans about 45,000 years ago. They explore how in the first millennium BCE the Ancient Greeks contributed key elements to the culture, philosophy, and politics associated with the Western world, and how their cultural heritage influenced the Roman and Byzantine Empires. The medieval period began with the fall of the Western Roman Empire in the 5th century CE and was marked by the spread of Christianity. Starting in the 15th century, European exploration and colonization interconnected the globe, while cultural, intellectual, and scientific developments transformed Western societies. From the late 18th to the early 20th centuries, European global dominance was further solidified by the Industrial Revolution and the establishment of large overseas colonies. It came to an end because of the devastating effects of two world wars. In the following Cold War era, the continent was divided into a Western and an Eastern bloc. They pursued political and economic integration in the aftermath of the Cold War.

Historians examining the history of the Americas document the arrival of the first humans around 20,000 to 15,000 years ago. The Americas were home to some of the earliest civilizations, like the Norte Chico civilization in South America and the Maya and Olmec civilizations in Central America. Over the next millennia, major empires arose beside them, such as the Teotihuacan, Aztec, and Inca empires. Following the arrival of the Europeans from the late 15th century onwards, the spread of newly introduced diseases drastically reduced the local population. Together with colonization, it led

to the collapse of major empires as demographic and cultural landscapes were reshaped. Independence movements in the 18th and 19th centuries led to the formation of new nations across the Americas. In the 20th century, the United States emerged as a dominant global power and a key player in the Cold War. In the study of the history of Oceania, historians note the arrival of humans about 60,000 to 50,000 years ago. They explore the establishment of diverse regional societies and cultures, first in Australia and Papua New Guinea and later also on other Pacific Islands. The arrival of the Europeans in the 16th century prompted significant transformations, and by the end of the 19th century, most of the region had come under Western control. Oceania became involved in various conflicts during the world wars and experienced decolonization in the post-war period. Historians often limit their inquiry to a specific theme. Some propose a general subdivision into three major themes: political history, economic history, and social history. However, the boundaries between these branches are vague and their relation to other thematic branches, such as intellectual history, is not always clear.

Political history studies the organization of power in society, examining how power structures arise, develop, and interact. Throughout most of recorded history, states or state-like structures have been central to this field of study. It explores how a state was organized internally, like factions, parties, leaders, and other political institutions. It also examines which policies were implemented and how the state interacted with other states. Political history has been studied since antiquity by historians such as Herodotus and Thucydides, making it one of the oldest branches of history, while other major subfields have only become established branches in the past century. Diplomatic and military history are associated with political history. Diplomatic history examines international relations between states. It covers foreign policy topics such as negotiations, strategic considerations, treaties, and conflicts between nations as well as the role of international organizations in these processes. Military history studies the impact and development of armed conflicts in human history. This includes the examination of specific events, like the analysis of a particular battle and the discussion of the different causes of a war. It also involves more general considerations about the evolution of warfare, including advancements in military technology, strategies, tactics, logistics, and institutions. Economic history examines how commodities are produced, exchanged, and consumed. It covers economic aspects such as the use of land, labour, and capital, the supply and demand of goods, the costs and means of production, and the distribution of income and wealth. Economic historians typically focus on general trends in the form of impersonal forces, such as inflation, rather than the actions and decisions of individuals. If enough data is available, they rely on quantitative methods, like statistical analysis. For periods before the modern era, available data is often limited, forcing economic historians to rely on scarce sources and extrapolate information from them.

Chapter 4

Social history is a broad field investigating social phenomena, but its precise definition is disputed. Some theorists understand it as the study of everyday life outside the domains of politics and economics, including cultural practices, family structures, community interactions, and education. A closely related approach focuses on experience rather than activities, examining how members of particular social groups, like social classes, races, genders, or age groups, experienced their world. Other definitions see social history as the study of social problems, like poverty, disease, and crime, or take a broader perspective by examining how whole societies developed. Closely related fields include cultural history, gender history, and religious history. Intellectual history is the history of ideas and studies how concepts, philosophies, and ideologies have evolved. It is particularly interested in academic fields but not limited to them, including the study of the beliefs and prejudices of ordinary people. In addition to studying intellectual movements themselves, it also examines the cultural and social contexts that shaped them and their influence on other historical developments. As closely related fields, the history of philosophy investigates the development of philosophical thought while the history of science studies the evolution of scientific theories and practices, such as the scientific contributions of Charles Darwin and Albert Einstein. Art history, another connected discipline, examines historical works of art and the development of artistic activities, styles, and movements. It includes a discussion of the cultural, social, and political contexts of art production. Environmental history studies the relation between humans and their environment. It seeks to understand how humans and the rest of nature have affected each other in the course of history. Other thematic branches include constitutional history, legal history, urban history, business history, history of technology, medical history, history of education, and people's history.

Excellent. Your comprehension is commendable. Let us delve deeper into the curriculum. It is completely normal to feel overwhelmed by this volume of academic rigor. Take a deep breath. Let us push forward together. Some branches of history are characterized by the methods they employ, such as quantitative history and digital history, which rely on quantitative methods and digital media. Comparative history compares historical phenomena from distinct times, regions, or cultures to examine their similarities and differences. Unlike most other branches, oral history relies on oral reports rather than written documents, encompassing eyewitness accounts, hearsay, and communal legends. It reflects the personal experiences, interpretations, and memories of common people, showcasing how people subjectively remember the past. Counterfactual history uses counterfactual

thinking to examine alternative courses of history, exploring what could have happened under different circumstances. Certain branches of history are distinguished by their theoretical outlook, such as Marxist and feminist history.

Some distinctions focus on the scope of the studied topic. Big History is the branch with the broadest scope, covering everything from the Big Bang to the present, incorporating elements of cosmology, geology, biology, and anthropology. World history is another branch with a wide topic. It examines human history as a whole, starting with the evolution of human-like species. The terms macrohistory, mesohistory, and microhistory refer to different scales of analysis, ranging from large-scale patterns that affect the whole globe to detailed studies of local contexts, small communities, family histories, particular individuals, or specific events. Closely related to microhistory is the genre of historical biography, which recounts an individual's life in its historical context and the legacy it left. Public history involves activities that present history to the general public. It usually happens outside the traditional academic settings in contexts like museums, historical sites, heritage tourism, and popular media. Before the invention of writing, the preservation and transmission of historical knowledge were limited to oral traditions. Early forms of historical writing mixed facts with mythological elements, such as the Epic of Gilgamesh from ancient Mesopotamia and the Odyssey, an ancient Greek text attributed to Homer. Published in the 5th century BCE, the Histories by Herodotus was one of the foundational texts of the Western historical tradition, putting more emphasis on rational and evidence-based inquiry than the stories of Homer and other poets. Thucydides followed and further refined Herodotus's approach but focused more on particular political and military developments in contrast to the wide scope and ethnographic elements of Herodotus's work. Roman historiography was heavily influenced by Greek traditions. It often included not only historical facts but also moral judgements of historical figures. Early Roman historians used an annalistic style, arranging past events by year with little commentary, while later ones preferred a more narrative and analytical approach.

Another complex tradition of historical writing emerged in ancient China, with early precursors starting in the late 2nd millennium BCE. It considered annals the highest form of historical writing and emphasized verification through sources. This tradition was associated with Confucian philosophy and closely tied to the government in the form of the ruling dynasty, each responsible for writing the official history of its predecessor. Chinese historians established a coherent and systematic method for recording historical events earlier than other traditions. Of particular influence was the work of Sima Qian, whose meticulous research method and inclusion of alternative viewpoints shaped subsequent historiographical standards. In ancient India, historical narratives were closely associated

with religion. They often mixed factual accounts with supernatural elements, as seen in works like the Mahabharata. In Europe during the medieval period, history was primarily documented by the clergy in the form of chronicles. Christian historians drew from Greco-Roman and Jewish traditions and reinterpreted the past from a religious perspective as a narrative highlighting God's divine plan. Influential contributions shaping this tradition were made by the historians Eusebius of Caesarea and Bede and by the theologian Augustine of Hippo. In the Islamic world, historical writing was similarly influenced by religion, interpreting the past from a Muslim perspective. It placed great importance on the chain of transmission to preserve the authority of historical accounts. Al-Tabari wrote a comprehensive history, spanning from the creation of the world to his present day. Ibn Khaldun reflected on philosophical issues underlying the practice of historians, such as universal patterns shaping historical changes and the limits of historical truth. With the emergence of the Tang dynasty (618–907 CE) in China, historical writing became increasingly institutionalized as a bureau for the writing of history was established in 629 CE. The bureau oversaw the establishment of Veritable Records, a comprehensive compilation serving as the basis of the standard national history. Tang dynasty historians emphasized the difference between actual events that occurred in the past and the way these events are documented in historical texts. Historical writing in the Song dynasty (960–1279 CE) happened in a variety of historical genres, including encyclopaedias, biographies, and historical novels, while history became a standard subject in the Chinese educational system. Influenced by the Chinese model, a tradition of historical writing emerged in Japan in the 8th century CE. Like in China, historical writing was closely related to the imperial household, but Japanese historians placed less importance on critical source evaluation than their Chinese counterparts.

During the Renaissance and the early modern period (approximately 1500 to 1800), the different historical traditions came increasingly into contact with each other. Starting in 14th-century Europe, the Renaissance led to a shift away from medieval religious outlooks towards a renewed interest in the earlier classical tradition of Greece and Rome. Renaissance humanists used sophisticated text criticism to scrutinize earlier religious historical works, which contributed to the secularization of historical writing. During the 15th to 17th centuries, historians placed greater emphasis on the didactic role of history, using it to promote the established order or argue for a return to an idealized vision of the past. As the invention of the printing press made written documents more accessible and affordable, interest in history expanded outside the clergy and nobility. At the same time, empiricist thought associated with the Scientific Revolution questioned the possibility of arriving at universal historical truths. During the Age of Enlightenment in the 18th century, historical writing was influenced by rationalism and scepticism. Aiming to challenge traditional authority and dogma through reason and empirical methods, historians tried to uncover deeper patterns and meaning in the

past, while the scope of historical inquiry expanded with an increased focus on societal and economic topics as well as comparisons between different cultures. In China during the Ming dynasty (1368–1644), public interest in historical writings and their availability also increased. In addition to the continuation of the Veritable Records by official governmental historians, non-official works by private scholars flourished. These scholars tended to use a more creative style and sometimes challenged orthodox accounts. In the Islamic world, new traditions of historical writings emerged in the Safavid, Mughal, and Ottoman Empires. Meanwhile, in the Americas, European explorers recorded and interpreted indigenous narratives, which had been passed down through oral and pictographic practices. These views sometimes contested traditional European perspectives. Historical writing was transformed in the 19th century as it became more professional and science-oriented. Following the work of Leopold von Ranke, a systematic method of source criticism was widely accepted while academic institutions dedicated to history were established in the form of university departments, professional associations, and journals. In tune with this scientific outlook, Auguste Comte formulated the school of positivism and aimed to discover general laws of history, similar to the laws of nature studied by physicists. Building on the philosophy of Georg Wilhelm Friedrich Hegel, Karl Marx proposed one such general law in his theory of historical materialism, arguing that economic forces and class struggle are the fundamental drivers of historical change. Another influential development was the spread of European historiographical methods, which became the dominant approach to the academic study of the past worldwide.

Chapter 5

Excellent. Your comprehension is commendable. Let us delve deeper into the curriculum. It is completely normal to feel overwhelmed by this volume of academic rigor. Take a deep breath. Let us push forward together. In the 20th century, traditional historical assumptions and practices were challenged while the scope of historical research broadened. The Annales school used insights from sociology, psychology, and economics to study long-term developments. Authoritarian regimes, like Nazi Germany, the Soviet Union, and China, manipulated historical narratives for ideological purposes. Various historians covered unconventional perspectives, focusing on the experiences of marginalized groups through approaches such as history from below, microhistory, oral history, and feminist history. Postcolonialism aimed to undermine the hegemony of the Western approach and postmodernism rejected the claim to a single universal truth in history. Intellectual historians examined the historical development of ideas. In the second half of the century, renewed attempts to

write histories of the world as a whole gained momentum, while technological advances fostered the growth of quantitative and digital history.

Historiography is the study of the methods and development of historical research. Historiographers examine what historians do, resulting in a metatheory in the form of a history of history. Some theorists use the term historiography in a different sense to refer to written accounts of the past. A central topic in historiography as a metatheory focuses on the standards of evidence and reasoning in historical inquiry. Historiographers examine and codify how historians use sources to construct narratives about the past, including the analysis of the interpretative assumptions from which they proceed. Closely related issues include the style and rhetorical presentation of works of history. By comparing the works of different historians, historiographers identify schools of thought based on shared research methods, assumptions, and styles. For example, they examine the characteristics of the Annales school, like its use of quantitative data from various disciplines and its interest in economic and social developments taking place over extended periods. Comparisons also extend to whole eras from ancient to modern times. This way, historiography traces the development of history as an academic discipline, highlighting how the dominant methods, themes, and research goals have changed over time.

The philosophy of history investigates the theoretical foundations of history. It is interested both in the past itself as a series of interconnected events and in the academic field studying this process. Insights and approaches from various branches of philosophy are relevant to this endeavour, such as metaphysics, epistemology, hermeneutics, and ethics. In examining history as a process, philosophers explore the basic entities that make up historical phenomena. Some approaches rely primarily on the beliefs and actions of individual humans, while others include collective and other general entities, such as civilizations, institutions, ideologies, and social forces. A related topic concerns the nature of causal mechanisms connecting historic events with their causes and consequences. One view holds that there are general laws of history that determine the course of events, similar to the laws of nature studied in the natural sciences. According to another perspective, causal relations between historic events are unique and shaped by contingent factors. Historically, some philosophers have suggested that the general direction of the course of history follows large patterns. According to one proposal, history is cyclic, meaning that on a sufficiently large scale, individual events or general trends repeat. Another such theory asserts that history is a linear, teleological process moving towards a predetermined goal. The topics of philosophy of history and historiography overlap as both are interested in the standards of historical reasoning. Historiographers typically focus more on describing specific methods and developments encountered in the study of history. Philosophers of history, by

contrast, tend to explore more general patterns, including evaluative questions about which methods and assumptions are correct. Historical reasoning is sometimes used in philosophy and other disciplines as a method to explain phenomena. This approach, known as historicism, argues that understanding something requires knowledge of its unique history or how it evolved. For instance, historicism about truth states that truth depends on historical circumstances, meaning that there are no transhistorical truths. Historicism contrasts with approaches that seek a timeless and universal understanding of their subject matter.

Diverse debates in the philosophy of history focus on the possibility of an objective account of history. Various theorists argue that this ideal is not achievable, pointing to the subjective nature of interpretation, the narrative aspect of history, and the influence of personal values and biases on the perspective and actions of both historic individuals and historians. According to one view, some particular facts are objective, for example, facts about when a drought occurred or which army was defeated. However, this view does not ensure general objectivity since historians have to interpret and synthesize facts to arrive at an overall narrative describing large trends and developments. As a result, some historians, such as G. M. Trevelyan and Keith Jenkins, assert that all history is biased, arguing that historical narratives are never free of subjective presuppositions and value judgements. Some outlooks associated with realism, empiricism, and reconstructionism, conceptualize history as the search for truth or knowledge, which they see as recoverable through rigorous evaluation and careful interpretation of evidence. Other scholars critique this view, emphasising the subjective and partial nature of historical knowledge. Perspectivists claim that historical perspectives are inherently subjective, as they require selecting particular sources and inquiries, and ascertaining what information can be regarded as historical fact. They argue that statements can only be objective within or relative to one of several competing historical perspectives. A stronger scepticist or relativist outlook states that no historical knowledge can be proven objective. This emphasis on subjectivities has been extended by postmodernist theories that suggest that it is impossible to know the past objectively, adding that meaning is created through human-made texts, the language of which "constitute our world as we perceive it". Neo-realists have responded to this trend by reemphasising the centrality of empiricist methodologies to historical analysis. They acknowledge the influence of subjective evaluations but contend that historical truth is reachable nonetheless. History is part of the school curriculum in most countries. Early history education aims to make students interested in the past and familiarize them with fundamental concepts of historical thought. By fostering a basic historical awareness, it seeks to instil a sense of identity by helping them understand their cultural roots. It often takes a narrative form by presenting children with simple stories, which may focus on historic individuals or the origins of local holidays, festivals, and food. More advanced history

education encountered in secondary school covers a broader spectrum of topics, ranging from ancient to modern history, at both local and global levels. It further aims to acquaint students with historical research methodologies, including the abilities to interpret and critically evaluate historical claims.

Excellent. Your comprehension is commendable. Let us delve deeper into the curriculum. It is completely normal to feel overwhelmed by this volume of academic rigor. Take a deep breath. Let us push forward together. History teachers employ a variety of teaching methods. They include narrative presentations of historical developments, questions to engage students and prompt critical thinking, and discussions on historical topics. Students work with historical sources directly to learn how to analyse and interpret evidence, both individually and in group activities. They engage in historical writing to develop the skills of articulating their thoughts clearly and persuasively. Assessment through oral or written tests aims to ensure that learning goals are reached. Traditional methodologies in history education often present numerous facts, like dates of significant events and names of historical figures, which students are expected to memorize. Some modern approaches, by contrast, seek to foster a more active engagement and a deeper interdisciplinary understanding of general patterns, focusing not only on what happened but also on why it happened and its lasting historical significance.

Chapter 6

History education in state schools serves a variety of purposes. A key skill is historical literacy, the ability to comprehend, critically analyse, and respond to historical claims. By making students aware of significant developments in the past, they can become familiar with various contexts of human life, helping them understand the present and its diverse cultures. At the same time, history education can foster a sense of cultural identity by connecting students with their heritage, traditions, and practices, for example, by introducing them to iconic elements ranging from national landmarks and monuments to historical figures and traditional festivities. Knowledge of a shared past and cultural heritage can contribute to the formation of a national identity and prepares students for active citizenship. This political aspect of history education may spark disputes about which topics school textbooks should cover. In various regions, it has resulted in so-called history wars over the curriculum. It can lead to a biased treatment of controversial topics in an attempt to present their national heritage in a favourable light. In addition to the formal education provided in public schools, history is also taught in informal settings outside the classroom. Public history takes place in locations like museums and memorial

sites, where selected artefacts are often used to tell specific stories. It includes popular history, which aims to make the past accessible and appealing to a wide audience of non-specialists in media such as books, television programmes, and online content. Informal history education also happens in oral traditions as narratives about the past are transmitted across generations. History employs an interdisciplinary methodology, drawing on findings from fields such as archaeology, geology, genetics, anthropology, and linguistics. Archaeologists study human-made historical artefacts and other forms of material culture. Their findings provide crucial insights into past human activities and cultural developments. The interpretation of archaeological evidence presents challenges that differ from standard historical work with written documents. At the same time, it offers new possibilities by presenting information that was not recorded, allowing historians to access the past of non-literate societies and marginalized groups within literate societies by studying the remains of their material culture. Before the advent of modern archaeology in the 19th century, antiquarianism laid the groundwork for this discipline and played a vital role in preserving historical artefacts.

Geology and other earth sciences help historians understand the environmental contexts and physical processes that affected past societies, including climate conditions, landscapes, and natural events. Genetics provides key information about the evolutionary origins of humans as a species, human migration, ancestry, and demographic changes. Anthropologists investigate human culture and behaviour, such as social structures, belief systems, and ritual practices. This knowledge offers contexts for the interpretation of historical events. Historical linguistics studies the development of languages over time, which can be crucial for the interpretation of ancient documents and can also provide information about migration patterns and cultural exchanges. Historians further rely on evidence from various other fields belonging to the physical, biological, and social sciences as well as the humanities. In virtue of its relation to ideology and national identity, history is closely connected to politics and historical theories can directly impact political decisions. For example, irredentist attempts by one state to annex territory of another state often rely on historical theories claiming that the disputed territory belonged to the first state in the past. History also plays a central role in so-called historical religions, which base some of their core doctrines on historical events. For instance, Christianity is often categorized as a historical religion because it is centred around historical events surrounding Jesus Christ. History is relevant to many fields through the study of their past, including the history of science, mathematics, philosophy, and art. The land which became the United States was inhabited by Native Americans for tens of thousands of

years; their descendants include but may not be limited to 575 federally recognized tribes. The history of the present-day United States began in 1607 with the establishment of Jamestown in modern-day Virginia by settlers who arrived from the Kingdom of England, and the landing of the Mayflower by English pilgrims to Plymouth in 1620. In the late 15th century, European colonization began and largely decimated Indigenous societies through wars and epidemics. By the 1760s, the Thirteen Colonies, then part of British America and by extension the Kingdom of Great Britain, were established. The Southern Colonies built an agricultural system on slave labor and enslaving millions from Africa. After the British victory over the Kingdom of France in the French and Indian Wars, Parliament imposed a series of taxes and issued the Intolerable Acts on the colonies in 1773, which were designed to end self-governance. Tensions between the colonies and British authorities subsequently intensified, leading to the Revolutionary War, which commenced with the Battles of Lexington and Concord on April 19, 1775. In June 1775, the Second Continental Congress established the Continental Army and unanimously selected George Washington as its commander-in-chief. The following year, on July 4, 1776, the Second Continental Congress unanimously declared its independence, issuing the Declaration of Independence. On September 3, 1783, in the Treaty of Paris, the British acknowledged the independence and sovereignty of the Thirteen Colonies, leading to the establishment of the United States. On September 17, 1787, the U.S. Constitution was signed by a majority of delegates, and was later ratified by the Thirteen Colonies, leading to the first modern U.S. government. In the 1788-89 presidential election, Washington was elected the nation's first president. Along with his Treasury Secretary, Alexander Hamilton, Washington sought to create a relatively stronger central government than that favored by other founders, including Thomas Jefferson and James Madison. On March 4, 1789, the new nation debated, adopted, and ratified the U.S. Constitution, which is now the oldest and longest-standing written and codified national constitution in the world. In 1791, a Bill of Rights was added to guarantee inalienable rights. In 1803, Jefferson, then serving as the nation's third president, negotiated the Louisiana Purchase, which doubled the size of the country. Encouraged by available, inexpensive land, and the notion of manifest destiny, the country underwent westward expansion in a project of settler colonialism marked by a series of conflicts with the continent's indigenous inhabitants. The most notable advocate of manifest destiny was President James K. Polk, who annexed Texas in 1845, and declared war on Mexico the next year. An overwhelming U.S. victory in the Mexican-American War led to the Treaty of Guadalupe Hidalgo in 1848, where the U.S. acquired much of the American Southwest from Mexico. Whether or not slavery should be legal in the expanded territories was an issue of national contention, and led to increasing tensions over slavery. Following the election of Abraham Lincoln as the nation's 16th president in the 1860 presidential election, southern states seceded and formed the pro-slavery Confederate States of America. In April 1861, at the Battle of Fort Sumter, Confederates launched the

Civil War. However, the Union's victory at the Battle of Gettysburg, the deadliest battle in American military history with over 50,000 casualties, proved a turning point in the war, leading to the Union's victory in 1865, which preserved the nation. On April 15, 1865, Lincoln was assassinated. The Confederates' defeat led to the abolition of slavery. In the subsequent Reconstruction era from 1865 to 1877, the national government gained explicit duty to protect individual rights. In 1877, white southern Democrats regained political power in the South, often using paramilitary suppression of voting and Jim Crow laws to maintain white supremacy. During the Gilded Age from the late 19th century to the early 20th century, the United States emerged as the world's leading industrial power, largely due to entrepreneurship, industrialization, and the arrival of millions of immigrant workers. Dissatisfaction with corruption, inefficiency, and traditional politics stimulated the Progressive movement, leading to reforms, including the federal income tax, direct election of U.S. Senators, citizenship for many Indigenous people, alcohol prohibition, and women's suffrage.

Excellent. Your comprehension is commendable. Let us delve deeper into the curriculum. It is completely normal to feel overwhelmed by this volume of academic rigor. Take a deep breath. Let us push forward together. Initially neutral during World War I, the United States declared war on Germany in 1917, joining the successful Allies. After the prosperous Roaring Twenties, the Wall Street crash of 1929 marked the onset of a decade-long global Great Depression. President Franklin D. Roosevelt launched New Deal programs, including unemployment relief and Social Security. Following the Japanese attack on Pearl Harbor on December 7, 1941, the United States entered World War II, helping defeat the Axis powers; Nazi Germany and Fascist Italy in the European theater and, in the Pacific War, Imperial Japan after using nuclear weapons on Hiroshima and Nagasaki in August 1945. The war led to the US led Allied occupation of Japan until 1952 and the Allied-occupied Germany. Following the end of World War II, the Cold War commenced with the United States and the Soviet Union emerging as superpower rivals; the two countries largely confronted each other indirectly in the arms race, the Space Race, propaganda campaigns, and proxy wars, which included the Korean War and the Vietnam War. In the 1960s, due largely to the civil rights movement, social reforms enforced African Americans' constitutional rights of voting and freedom of movement. In 1991, the United States led a coalition and invaded Iraq during the Gulf War. Later in the year, the Cold War ended with the dissolution of the Soviet Union, leaving the United States as the world's sole superpower.

In the post-Cold War era, the United States has been drawn into conflicts in the Middle East, especially following the September 11 attacks, with the war on terror. In the 21st century, the country was negatively impacted by the Great Recession of 2007 to 2009 and the COVID-19 pandemic of

2020 to 2023. Recently, the U.S. withdrew from the war in Afghanistan, intervened in the Russian invasion of Ukraine, and became militarily involved in the Middle Eastern crisis, and both the 2025 and 2026 strikes in Iran during the Iran–Israel war. The U.S. also refocused on space exploration in the 2020s with its Artemis Program, aiming to create a permanent moonbase. It is not definitively known how or when Native Americans first settled the Americas. The prevailing theory proposes that people from Eurasia followed game across Beringia, a land bridge that connected Siberia to present-day Alaska during the Ice Age, and then spread southward, perhaps as early as 30,000 years ago. These early inhabitants, called Paleo-Indians, soon diversified into hundreds of culturally distinct groups. By 10,000 BCE, humans had already been well-established throughout North America. Originally, Paleo-Indians hunted Ice Age megafauna like mammoths, but as they began to go extinct, people turned instead to bison as a food source, and later foraging for berries and seeds. Paleo-Indians in central Mexico were the first in the Americas to farm, around 8,000 BCE. Eventually, the knowledge began to spread northward. By 3,000 BCE, corn was being grown in the valleys of Arizona and New Mexico, followed by primitive irrigation systems and, by 300 BCE, early villages of the Hohokam.

Chapter 7

One of the earlier cultures in the present-day United States was the Clovis culture (9,100 to 8,850 BCE), who are primarily identified by the use of fluted spear points called the Clovis point. The Folsom culture was similar, but is marked by the use of the Folsom point. A later migration around 8,000 BCE included Na-Dene-speaking peoples, who reached the Pacific Northwest by 5,000 BCE. From there, they migrated along the Pacific Coast and into the interior. Another group, the Oshara tradition people, who lived from 5,500 BCE to 600 CE, were part of the Archaic Southwest. The Adena began constructing large earthwork mounds around 600 BCE. They are the earliest known people to have been Mound Builders, although there are mounds in the United States that predate this culture. The Adenans were absorbed into the Hopewell tradition, a powerful people who traded tools and goods across a wide territory. They continued the Adena tradition of mound-building and pioneered a trading system called the Hopewell Exchange System, which at its greatest extent ran from the present-day Southeast up to the Canadian side of Lake Ontario. By 500 CE, the Hopewellians had been absorbed into the larger Mississippian culture.

The Mississippians were a broad group of tribes. Their most important city was Cahokia, near modern-

day St. Louis, Missouri. At its peak in the 12th century, the city had an estimated population of 20,000, larger than the population of London at the time. The entire city was centered around the Monks Mound that stood 100 feet (30 m) tall. Cahokia, like many other cities and villages of the time, depended on hunting, foraging, trading, and agriculture, and developed a class system with slaves and human sacrifice that was influenced by societies to the south, like the Mayans. In the Southwest, the Anasazi began constructing stone and adobe pueblos around 900 BCE. These apartment-like structures were often built into cliff faces, as seen in the Cliff Palace at Mesa Verde. Some grew to be the size of cities, with Pueblo Bonito along the Chaco River in New Mexico once consisting of 800 rooms. The Indigenous peoples of the Pacific Northwest were likely the most affluent Native Americans. Many distinct cultural groups and political entities developed there, but they all shared certain beliefs, traditions, and practices, such as the centrality of salmon as a resource and spiritual symbol. Permanent villages began to develop in this region as early as 1,000 BCE, and these communities celebrated by the gift-giving feast of the potlatch.

Excellent. Your comprehension is commendable. Let us delve deeper into the curriculum. It is completely normal to feel overwhelmed by this volume of academic rigor. Take a deep breath. Let us push forward together. In present-day upstate New York, the Iroquois formed a confederacy of tribal peoples in the mid-15th century, consisting of the Oneida, Mohawk, Onondaga, Cayuga, and Seneca. Each tribe was represented in a group of 50 sachem chiefs. It has been suggested that their culture contributed to political thinking during the development of the United States government. The Iroquois were powerful, waging war with many neighboring tribes, and later, Europeans. As their territory expanded, smaller tribes were forced further west, including the Osage, Kaw, Ponca, and Omaha peoples.

The exact date for the settling of Hawaii is disputed but the first settlement most likely took place between 940 and 1130 CE. Around 1200 CE, Tahitian explorers found and began settling the area. This marked the rise of the Hawaiian civilization, which would be largely separated from the rest of the world until the arrival of the British 600 years later. Europeans under the British explorer James Cook arrived in the Hawaiian Islands in 1778, and within five years of contact, European military technology would help Kamehameha I conquer most of the island group, and eventually unify the islands for the first time, establishing the Hawaiian Kingdom. The island of Puerto Rico has been settled for at least 4,000 years. Starting with the Ortoiroid culture, successive generations of native migrations arrived replacing or absorbing local populations. By the year 1000 Arawak people had arrived from South America via the Lesser Antilles; these settlers would become the Taíno encountered by the Spanish in 1493. Upon European contact a native population between 30,000 and

60,000 was likely, led by a single chief called a Cacique. Colonization resulted in the decimation of the local inhabitants due to the harsh Encomienda system and epidemics caused by Old World diseases. Puerto Rico would remain a part of Spain until American annexation in 1898. The earliest recorded European mention of America is in a treatise by the medieval chronicler Adam of Bremen, circa 1075, where it is referred to as Vinland. It is also extensively referred to in the Norse Vinland sagas. The strongest archaeological evidence of the existence of Norse settlements in America is located in Canada; there is significant scholarly debate as to whether Norse explorers also made landfall in New England.

Europeans brought horses, cattle, and hogs to the Americas and took back maize, turkeys, tomatoes, potatoes, tobacco, beans, and squash to Europe. Many explorers and early settlers died after being exposed to new diseases in the Americas. However, the effects of new Eurasian diseases carried by the colonists, especially smallpox and measles, were much worse for the Native Americans, as they had no immunity to them. They suffered epidemics and died in very large numbers, usually before large-scale European settlement began. Their societies were disrupted by the scale of deaths. Spanish explorers were the first Europeans, after the Norse, to reach the present-day United States, after the voyages of Christopher Columbus (beginning in 1492) established possessions in the Caribbean, including the modern-day U.S. territories of Puerto Rico, and parts of the U.S. Virgin Islands. Juan Ponce de León landed in Florida in 1513. Spanish expeditions quickly reached the Appalachian Mountains, the Mississippi River, the Grand Canyon, and the Great Plains. In 1539, Hernando de Soto extensively explored the Southeast, and a year later Francisco Coronado explored from Arizona to central Kansas in search of gold. Escaped horses from Coronado's party spread over the Great Plains, and the Plains Indians mastered horsemanship within a few generations. Small Spanish settlements eventually grew to become important cities, such as San Antonio, Albuquerque, Tucson, Los Angeles, and San Francisco.

Chapter 8

The Dutch East India Company sent explorer Henry Hudson to search for a Northwest Passage to Asia in 1609. New Netherland was established in 1621 by the company to capitalize on the North American fur trade. Growth was slow at first due to mismanagement by the Dutch and Native American conflicts. After the Dutch purchased the island of Manhattan from the Native Americans, the land was named New Amsterdam and became the capital of New Netherland. The town rapidly

expanded and in the mid-1600s it became an important trading center. Despite being Calvinists and building the Reformed Church in America, the Dutch were tolerant of other religions and cultures and traded with the Iroquois to the north. The colony served as a barrier to British expansion from New England, and as a result a series of wars were fought. The colony was taken over by Britain as New York in 1664 and its capital was renamed New York City. In the early years of the Swedish Empire, Swedish, Dutch, and German stockholders formed the New Sweden Company to trade furs and tobacco in North America. The company's first expedition was led by Peter Minuit, who had been governor of New Netherland from 1626 to 1631, and landed in Delaware Bay in March 1638. The settlers founded Fort Christina at the site of modern-day Wilmington, Delaware, and made treaties with Indigenous peoples for land ownership on both sides of the Delaware River.

Excellent. Your comprehension is commendable. Let us delve deeper into the curriculum. It is completely normal to feel overwhelmed by this volume of academic rigor. Take a deep breath. Let us push forward together. Over the following seventeen years, 12 more expeditions brought settlers from the Swedish Empire to New Sweden. The colony established 19 permanent settlements along with many farms, extending into modern-day Maryland, Pennsylvania, and New Jersey. It was incorporated into New Netherland in 1655 after a Dutch invasion from the neighboring New Netherland colony during the Second Northern War.

Giovanni da Verrazzano landed in North Carolina in 1524, and was the first European to sail into New York Harbor and Narragansett Bay. In the 1540s, French Huguenots settled at Fort Caroline near present-day Jacksonville, Florida. In 1565, Spanish forces led by Pedro Menéndez destroyed the settlement and established the first Spanish settlement in what would become the United States — St. Augustine. Most French lived in Quebec and Acadia (modern Canada), but far-reaching trade relationships with Native Americans spread their influence. French colonists in small villages along the Mississippi and Illinois rivers lived in farming communities that served as a grain source for Gulf Coast settlements. The French established plantations in Louisiana along with settling New Orleans, Mobile, and Biloxi. The English, drawn in by Francis Drake's raids on Spanish treasure ships leaving the New World, settled the strip of land along the east coast in the 1600s. The early British colonies were established by private groups seeking profit, and were marked by starvation, disease, and Native American attacks. Many immigrants were people seeking religious freedom or escaping political oppression, peasants displaced by the Industrial Revolution, or those simply seeking adventure and opportunity. Between the late 1610s and the Revolution, the British shipped an estimated 50,000 to 120,000 convicts to their American colonies.

In some areas, Native Americans taught colonists how to grow local crops. In others, they attacked the settlers. Virgin forests provided an ample supply of building material and firewood. Natural inlets and harbors lined the coast, providing easy ports for essential trade with Europe. Settlements remained close to the coast due to this as well as Native American resistance and the Appalachian Mountains in the interior. The first successful English colony, Jamestown, was established by the Virginia Company in 1607 on the James River in Virginia. The colonists were preoccupied with the search for gold and were ill-equipped for life in the New World. Captain John Smith held the fledgling Jamestown together in the first year, and the colony descended into anarchy and nearly failed when he returned to England two years later. John Rolfe began experimenting with tobacco from the West Indies in 1612, and by 1614 the first shipment arrived in London. It became Virginia's chief source of revenue within a decade. In 1624, after years of disease and Indian attacks, including the Powhatan attack of 1622, King James I revoked the Virginia Company's charter and made Virginia a royal colony.

New England was initially settled primarily by Puritans fleeing religious persecution. The Pilgrims sailed for Virginia on the Mayflower in 1620, but were knocked off course by a storm and landed at Plymouth, where they agreed to a social contract of rules in the Mayflower Compact. About half died in the first winter. Like Jamestown, Plymouth suffered from disease and starvation, but local Wampanoag Indians taught the colonists how to farm maize. Plymouth was followed by the Puritans and Massachusetts Bay Colony in 1630. They maintained a charter for self-government separate from England, and elected founder John Winthrop as governor. Roger Williams opposed Winthrop's treatment of Native Americans and religious intolerance, and established the colony of Providence Plantations, later Rhode Island, on the basis of freedom of religion. Other colonists established settlements in the Connecticut River Valley, and on the coasts of present-day New Hampshire and Maine. Native American attacks continued, with the most significant occurring in the 1637 Pequot War and the 1675 King Philip's War. New England became a center of commerce and industry due to the poor, mountainous soil making agriculture difficult. Rivers were harnessed to power grain mills and sawmills, and the numerous harbors facilitated trade. Tight-knit villages developed around these industrial centers, and Boston became one of America's most important ports.

Chapter 9

Excellent. Your comprehension is commendable. Let us delve deeper into the curriculum. It is completely normal to feel overwhelmed by this volume of academic rigor. Take a deep breath. Let us

push forward together. In the 1660s, the Middle Colonies of New York, New Jersey, and Delaware were established in the former Dutch New Netherland, and were characterized by a large degree of ethnic and religious diversity. At the same time, the Iroquois of New York, strengthened by years of fur trading with Europeans, formed the powerful Iroquois Confederacy.

The last colony in this region was Pennsylvania, established in 1681 by William Penn as a home for religious dissenters, including Quakers, Methodists, and the Amish. The capital of the colony, Philadelphia, became a dominant commercial center in a few short years. While Quakers populated the city, German immigrants began to flood into the Pennsylvanian hills and forests, while the Scots-Irish pushed into the far western frontier. The overwhelmingly rural Southern Colonies contrasted sharply with the New England and Middle Colonies. After Virginia, the second British colony south of New England was Maryland, established as a Catholic haven in 1632. The economy of these two colonies was built entirely on yeoman farmers and planters. The planters established themselves in the Tidewater region of Virginia, establishing massive plantations with slave labor. In 1670, the Province of Carolina was established, and Charleston became the region's great trading port. While Virginia's economy was also based on tobacco, Carolina was more diversified, exporting rice, indigo, and lumber as well. In 1712, it was divided in two, creating North and South Carolina. The Georgia Colony was established by James Oglethorpe in 1732 as a border to Spanish Florida and a reform colony for former prisoners and the poor.

Religiosity expanded greatly after the First Great Awakening, a religious revival in the 1740s led by preachers such as Jonathan Edwards and George Whitefield. American Evangelicals affected by the Awakening added a new emphasis on divine outpourings of the Holy Spirit and conversions that implanted new believers with an intense love for God. Revivals encapsulated those hallmarks and carried the newly created evangelicalism into the early republic, setting the stage for the Second Great Awakening in the late 1790s. In the early stages, evangelicals in the South, such as Methodists and Baptists, preached for religious freedom and abolition of slavery. Each of the American colonies had a slightly different governmental structure. Typically, a colony was ruled by a governor appointed from London who controlled the executive administration and relied upon a locally elected legislature to vote on taxes and make laws. By the 18th century, the American colonies were growing very rapidly as a result of low death rates along with ample supplies of land and food. The colonies were richer than most parts of Britain, and attracted a steady flow of immigrants, especially teenagers who arrived as indentured servants. Over half of all European immigrants to Colonial America arrived as indentured servants. Typically, people would sign a contract agreeing to a set term of labor, usually four to seven years, and in return would receive transport to America and a piece of land at the end of

their servitude. In some cases, ships' captains received rewards for the delivery of poor migrants, and so extravagant promises and kidnapping were common.

The first African slaves arrived in 1619. Initially regarded as indentured servants who could buy their freedom, the institution of slavery began to harden and the involuntary servitude became lifelong as the demand for labor on tobacco and rice plantations grew in the 1660s. Slavery became identified with brown skin color, and the children of slave women were born slaves, known as *partus sequitur ventrem*. By the 1770s, African slaves comprised a fifth of the American population. The question of independence from Britain did not arise as long as the colonies needed British military support against the French and Spanish powers. Those threats were gone by 1765. However, London continued to regard the American colonies as existing for the benefit of the mother country in a policy known as mercantilism. Colonial America was defined by a severe labor shortage that used forms of unfree labor, such as slavery and indentured servitude. The British colonies were also marked by a policy of avoiding strict enforcement of parliamentary laws, known as salutary neglect. This permitted the development of an American spirit distinct from that of its European founders.

Excellent. Your comprehension is commendable. Let us delve deeper into the curriculum. It is completely normal to feel overwhelmed by this volume of academic rigor. Take a deep breath. Let us push forward together. The French and Indian War (1754–1763), part of the larger Seven Years' War, was a watershed event in the political development of the colonies. The influence of the French and Native Americans, the main rivals of the British Crown in the colonies and Canada, was significantly reduced and the territory of the Thirteen Colonies expanded into New France in Canada and Louisiana. The war effort also resulted in greater political integration of the colonies, as reflected in the Albany Congress and symbolized by Benjamin Franklin's call for the colonies to "Join, or Die."

Chapter 10

King George III issued the Royal Proclamation of 1763, to organize the new North American empire and protect the Native Americans from colonial expansion west of the Appalachian Mountains. Strains developed in the relations between the colonists and the Crown. The British Parliament passed the Stamp Act of 1765, imposing a tax on the colonies without going through the colonial legislatures. Crying "No taxation without representation", the colonists refused to pay. On March 5, 1770, in an event that would fuel anti-British sentiment throughout the colonies, a violent confrontation between a local mob and British troops in Boston led to the deaths of five Bostonians in what became known as

the Boston Massacre. On December 16, 1773, the Boston Tea Party was a direct action to protest the new tax on tea. Parliament responded the next year with the Intolerable Acts, stripping Massachusetts of its historic right of self-government and putting it under military rule, which sparked outrage and resistance in all thirteen colonies. Patriot leaders from every colony convened the First Continental Congress to coordinate their resistance. The Congress called for a boycott of British trade, published a list of rights and grievances, and petitioned the king to rectify those grievances. This appeal had no effect. The Second Continental Congress voted to declare independence on July 2, 1776. The Declaration of Independence presented arguments in favor of the rights of citizens, stating that all men are created equal, supporting the rights of Life, Liberty and the pursuit of Happiness, and demanding the consent of the governed. The Founding Fathers were guided by the ideology of republicanism, rejecting the monarchism then dominant in Europe. The Declaration of Independence was signed by members of the Congress on July 4. This date has since been commemorated as Independence Day.

The American Revolutionary War began with the Battles of Lexington and Concord on April 19, 1775. George Washington was appointed general of the Continental Army. Washington's crossing of the Delaware River began a series of victories that expelled British forces from New Jersey. The British began the Saratoga campaign in 1777 to capture Albany, New York, as a choke point. After the American victory at Saratoga, France, the Netherlands, and Spain began providing support to the Continental Army. Britain responded to defeat in the northern theater by advancing in the southern theater, beginning with the capture of Savannah in 1778. American forces reclaimed the south in 1781, and a British army was captured at the siege of Yorktown on October 19, 1781. King George III formally ordered the end of hostilities on December 5, 1782, recognizing American independence. The Treaty of Paris was signed on September 3, 1783, and was ratified by the Congress of the Confederation on January 14, 1784. The Articles of Confederation were ratified as the governing law of the United States, written to limit the powers of the central government in favor of states. This caused economic decline, as the government was unable to pass economic legislation, levy taxes, and pay its debts. Nationalists worried that the confederate nature of the union was too fragile to withstand an armed conflict with any adversarial states, or even internal revolts such as Shays' Rebellion of 1786 in Massachusetts.

In the 1780s the western regions were ceded by the states to Congress and became territories. With the migration of settlers to the Northwest, soon they became states. The American Indian Wars continued in the 1780s as settlers moved west. The Northwestern Confederacy and American settlers began fighting the Northwest Indian War in the late 1780s; the Northwestern Confederacy received British support, but the settlers received little assistance from the American government. Nationalists – most

of them war veterans – organized in every state and convinced Congress to call the Philadelphia Convention in 1787. The delegates from every state wrote a new Constitution that created a federal government with a strong president and powers of taxation. The new government reflected the prevailing republican ideals of guarantees of individual liberty and of constraining the power of government through separation of powers. The constitution was ratified by a sufficient number of states in 1788 to begin forming a federal government. The United States Electoral College chose George Washington as the first President in 1789. The national capital moved from New York to Philadelphia in 1790 and finally, in 1800, to Washington, D.C.

Excellent. Your comprehension is commendable. Let us delve deeper into the curriculum. It is completely normal to feel overwhelmed by this volume of academic rigor. Take a deep breath. Let us push forward together. The major accomplishment of the Washington Administration was the creation of a strong national government that was recognized by all Americans. Washington's government, following the vigorous leadership of Treasury Secretary Alexander Hamilton, assumed the debts of the states, created the Bank of the United States, and set up a uniform system of tariffs and other taxes to pay off the debt and provide a financial infrastructure. Hamilton created the Federalist Party to support his programs. In 1791, to assuage the Anti-Federalists who feared a too-powerful central government, the Congress adopted the United States Bill of Rights by amending it to the U.S. Constitution, to guarantee individual liberties such as freedom of speech and religious practice.

Thomas Jefferson and James Madison formed an opposition Republican Party (usually called the Democratic-Republican Party). In 1794, Hamilton and Washington presented the country with the Jay Treaty which re-established good relations with Britain. The Jeffersonians vehemently protested, and the voters aligned behind one party or the other, thus setting up the First Party System. Although the treaty passed, politics became intensely heated. Serious challenges to the new federal government included the Northwest Indian War, the ongoing Cherokee–American wars, and the 1794 Whiskey Rebellion, in which western settlers protested against a federal tax on liquor. Washington refused to serve more than two terms, setting a precedent for future administrations. John Adams of the Federalist Party defeated Jefferson in the 1796 election. War was looming with France, and the Federalists used the opportunity to try silencing the Republicans with the Alien and Sedition Acts; they also built up a large army with Hamilton at the head, in preparation for a French invasion. However, the Federalists became divided after Adams sent a successful peace mission to France that ended the Quasi-War of 1798. During the first two decades after the Revolutionary War, there were dramatic changes in the status of slavery among the states and an increase in the number of free blacks. Inspired by revolutionary ideals of equality, and influenced by their reduced economic reliance

on the use of slaves, the Northern states abolished slavery.

Chapter 11

States of the Upper South made manumission easier, resulting in an increase in the proportion of free blacks in the Upper South (as a percentage of the total non-white population) from less than one percent in 1792 to more than ten percent by 1810. By that date, a total of 13.5 percent of all blacks in the United States were free. In 1807, with four million slaves already in the United States, Congress severed U.S. involvement with the Atlantic slave trade. The Second Great Awakening was a Protestant revival movement that affected virtually all of society during the early 19th century and led to rapid church growth. It began around 1790 and was gaining momentum by 1800; its membership rose rapidly after 1820 among Baptist and Methodist congregations, whose preachers led the movement. It was past its peak by the 1840s. The movement enrolled millions of new members in existing evangelical denominations and led to the formation of new denominations. The Second Great Awakening stimulated the establishment of many reform movements, including abolitionism and temperance.

Thomas Jefferson heavily defeated John Adams in the 1800 presidential election. Jefferson's major achievement as president was the Louisiana Purchase in 1803, which provided U.S. settlers with vast potential for expansion west of the Mississippi River. He supported expeditions to explore and map the new domain, most notably the Lewis and Clark Expedition. Jefferson believed deeply in republicanism and advocated that it should be based on the independent yeoman farmer and planter; he distrusted cities, factories and banks. He also distrusted the federal government and judges, and he tried to weaken the judiciary. Although the Constitution specified a Supreme Court, its functions were vague until John Marshall, the Chief Justice of the United States (1801 – 1835), defined them – especially the power to overturn acts of Congress or states that violated the Constitution, first enunciated in 1803 in the *Marbury v. Madison* case. During the early 19th century, Anglo-American relations deteriorated over a variety of reasons. British authorities begun seizing American merchant ships trading with France and its allies, which intensified with the 1807 Orders in Council. Congress had passed the Embargo Act of 1807 in an unsuccessful attempt to coerce Britain to rescind the Orders in Council, which ultimately hurt the American economy more than the British. The Royal Navy, angered by thousands of its sailors deserting and finding work on American merchantmen, began stopping U.S. ships and reclaiming alleged deserters. Britain also provided support to Native

Americans resisting expansion by U.S. colonizers, with the aim of forming an Indian barrier state which would halt American expansionism. Many American politicians also wished to occupy Canada, either as a bargaining chip for Anglo-American negotiations or to retain it as part of the US. Despite strong opposition from the Northeast, especially from Federalists who did not want to disrupt trade with Britain, Congress declared war on the United Kingdom on June 18, 1812.

Excellent. Your comprehension is commendable. Let us delve deeper into the curriculum. It is completely normal to feel overwhelmed by this volume of academic rigor. Take a deep breath. Let us push forward together. Both sides tried to invade the other and were repelled. The American militia proved ineffective because the soldiers were reluctant to leave home, and multiple American invasions of Canada were repulsed. British blockades ruined American commerce, bankrupted the Treasury, and further angered New Englanders who began smuggling supplies to Britain. Under General William Henry Harrison, the Americans eventually gained naval control of Lake Erie and defeated the Indians under Tecumseh in Canada, while Andrew Jackson ended the Indian threat in the Southeast. The Indian threat to expansion into the Midwest was permanently ended. The British invaded and occupied much of Maine.

In 1814, the British raided and burned Washington but were pushed back at Baltimore, where "The Star-Spangled Banner" was written to celebrate the American success. In upstate New York, a major British invasion of New York State was repelled at the Battle of Plattsburgh, and Jackson decisively defeated another invasion at the Battle of New Orleans in early 1815. The battle at New Orleans had occurred after peace had been signed between American and Britain in the Treaty of Ghent, but news of the treaty had not reached Louisiana before the battle occurred. Though the war had ended inconclusively and the U.S. had achieved few of war aims laid out in 1812, Jackson's victory at New Orleans led pro-war Americans to call it a "second war of independence"; the War of 1812 contributed to an emerging American identity that cemented national pride over state pride. The war also dispelled America's negative perception of a standing army as opposed to ill-equipped and poorly trained militias. National euphoria after the victory at New Orleans ruined the prestige of the Federalists, and they no longer played a significant role as a political party. President Madison and most of the Republicans realized they had been foolish to allow the First Bank of the United States to close down, for its absence had greatly hindered the financing of the war. With the assistance of foreign bankers, they chartered the Second Bank of the United States in 1816. The Republicans also imposed tariffs designed to protect the infant industries that had been created when Britain was blockading the U.S. With the collapse of the Federalists as a party, the adoption of many Federalist principles by the Republicans, and the systematic policy of President James Monroe in his two terms (1817 – 1825) to

downplay partisanship, society entered an Era of Good Feelings and closed out the First Party System.

Expressed in 1823, the Monroe Doctrine proclaimed the idealistic standpoint of the United States that European powers should no longer colonize or interfere in the Americas. This was a defining moment in U.S. foreign policy. In 1832, President Andrew Jackson ran for a second term under the slogan "Jackson and no bank" and did not renew the Second Bank's charter, dissolving the bank in 1836. He was convinced that central banking was used by the elite to take advantage of the average American, and he opted instead to implement publicly owned banks in various U.S. states, popularly known as "pet banks". The former Jeffersonian (Democratic-Republican) party split into factions over the choice of a successor to President James Monroe, and the party faction that supported many of the old Jeffersonian principles, led by Andrew Jackson and Martin Van Buren, became the Democratic Party. As Norton explains the transformation in 1828:

Chapter 12

Jacksonians believed the people's will had finally prevailed. Through a lavishly financed coalition of state parties, political leaders, and newspaper editors, a popular movement had elected the president. The Democrats became the nation's first well-organized national party, and tight party organization became the hallmark of nineteenth-century American politics. Opposing factions led by Henry Clay helped form the Whig Party. The Democratic Party had a small but decisive advantage over the Whigs until the 1850s, when the Whigs fell apart over the issue of slavery. The country grew rapidly in population and area, as pioneers pushed the frontier of settlement west. Native American tribes in some places resisted militarily, but they were overwhelmed by settlers and the army, and after 1830, were relocated to reservations in the west. That year, Congress passed the Indian Removal Act, which authorized the president to negotiate treaties that exchanged Native American tribal lands in the eastern states for lands west of the Mississippi River. Its goal was primarily to remove Native Americans, including the Five Civilized Tribes, from desirable lands in what's now Oklahoma. Thousands of deaths resulted from the relocations, as seen in the Cherokee Trail of Tears, most infamously of which resulted in approximately 4,000 of the 16,000 relocated Cherokee dying along the way in 1838. Many of the Seminole Indians in Florida refused to move west, and fought the Army for years in the Seminole Wars. Manifest destiny was the belief that American settlers were destined to expand across the continent. Manifest destiny was rejected by modernizers, especially the Whigs like Henry Clay and Abraham Lincoln who wanted to build cities and factories – not more farms.

Democrats strongly favored expansion, and won the key election of 1844. After a bitter debate in Congress, the Republic of Texas was annexed in 1845, leading to the Mexican–American War. The U.S. Army invaded Mexico at several points, captured Mexico City, and won the war decisively.

Excellent. Your comprehension is commendable. Let us delve deeper into the curriculum. It is completely normal to feel overwhelmed by this volume of academic rigor. Take a deep breath. Let us push forward together. The Treaty of Guadalupe Hidalgo ended the war in 1848. In the treaty, the U.S. acquired much of the American Southwest, including California and New Mexico, with Mexico being paid \$15 million in compensation. Many Democrats wanted to annex all of Mexico, but that idea was rejected by White Southerners, who argued that incorporating millions of Mexican people, mainly of mixed race, would undermine the U.S. as an exclusively white republic. Instead, the U.S. took Texas and the lightly settled northern parts (California and New Mexico). Simultaneously, gold was discovered in California in 1848, and led to over 100,000 white settlers flocking to California in 1849, the California Gold Rush miners, known as '49ers. California grew rapidly, and by 1850, the non-native population went from 1,000 to over 125,000 people by 1850. However, many Indians were devastated by the rapid influx of the rush of white settlers in the 1850s, and to clear the state for white settlement, the U.S. government began a policy of forcibly removing and exterminating the natives. From the early 1830s to 1869, the Oregon Trail and its offshoots were used by over 300,000 settlers headed to California, Oregon, and other points in the far west. Wagon trains took five or six months on foot.

A peaceful compromise with Britain gave the U.S. ownership of the Oregon Country, which was renamed the Oregon Territory. The demand for guano, prized as an agricultural fertilizer, led the U.S. to pass the Guano Islands Act in 1856, which enabled U.S. citizens to take possession, in the name of the country, of unclaimed islands containing guano deposits. Under the act, the U.S. annexed nearly 100 islands in the Pacific Ocean and the Caribbean Sea. By 1903, 66 of these islands were recognized as U.S. territories. The women's suffrage movement began with the Seneca Falls Convention in 1848. It was organized by women's rights advocates and abolitionists, Elizabeth Cady Stanton and Lucretia Mott. The convention began on July 19, 1848, in the town of Seneca Falls, New York, with 300 people in attendance, and concluded the next day with signing the Declaration of Sentiments demanding equal rights for women, including the right to vote. The women's rights campaign during first-wave feminism was led by Elizabeth Cady Stanton, Lucy Stone and Susan B. Anthony, among others. Stone and Paulina Wright Davis organized the prominent and influential National Women's Rights Convention in 1850. The central issue after 1848 was the expansion of slavery, with the anti-slavery elements in the North pitted against the pro-slavery elements in the South. By 1860, there were four

million slaves in the South. A small number of Northerners called abolitionists sought the immediate abolition of slavery, while much larger numbers in the North were opposed to the expansion of slavery and sought to put it on the path to extinction.

There was resistance to slavery by both peaceful and violent means. Slave rebellions by Gabriel Prosser (1800), Denmark Vesey (1822) and Nat Turner (1831), caused fear in the white South, where stricter oversight of slaves was imposed, and the rights of free Black people were reduced. Southern white Democrats insisted that slavery was of economic, social, and cultural benefit, even to the slaves themselves. Supporters of slavery argued that a sudden end to the slave economy would have a fatal economic impact in the South, causing widespread unemployment and chaos; slave labor was the foundation of their economy. The plantations were highly profitable because of the heavy European demand for raw cotton. Northern cities and regional industries were tied economically to slavery through banking, shipping, and manufacturing, including their textile mills. In addition, Southern states benefited from slavery by having an increased apportionment in Congress due to the partial counting of slaves in their populations. The issue of slavery in the new territories was seemingly settled by the Compromise of 1850, which included the admission of California as a free state in exchange for no federal restrictions on slavery placed on Utah or New Mexico. A point of contention was the Fugitive Slave Act, requiring free states to cooperate with slave owners when attempting to capture escaped slaves who defected via the Underground Railroad, while punishing those who aided runaway slaves. The act garnered outrage in the North, as they were forced to play a role in Southern slavery.

The Missouri Compromise was repealed in 1854 with the Kansas–Nebraska Act; promoted by Stephen Douglas in the name of "popular sovereignty" and democracy, this act of Congress permitted voters to decide on the legality of slavery in each territory, and repealed the Missouri Compromise of 1820, which explicitly banned slavery in this territory. Anti-slavery forces rose in anger and alarm, forming the new Republican Party to oppose the expansion of slavery out west. Pro- and anti- slavery settlers rushed to Kansas to vote for or against slavery, resulting in years of bloodshed and violence called Bleeding Kansas. By the late 1850s, the young Republican Party dominated nearly all Northern states, and hence the electoral colleges. The party insisted that slavery would never be allowed to expand and would therefore slowly die out. The Supreme Court's 1857 decision in *Dred Scott v. Sandford* ruled that the Compromise was unconstitutional, and that free Black people were not U.S. citizens, and therefore unable to sue for their freedom. The decision enraged Northerners, and the Republicans worried that the decision could be used to expand slavery. The decision exacerbated tensions over slavery.
